

Data Automation (Documents)

An important part of life as an engineer in the Data Automation team is developing new and maintaining different API integrations towards our data providers.

A good example of this would be the famous SEC (U.S. Securities and Exchange Commission) and their API. In this assignment you need to fetch the 10-K report, an annual report that the companies need to submit to the SEC.

In order to accomplish this you have to write the implementation that will pull the latest 10-K reports from some of the world's leading companies.

- Apple
- Meta
- Alphabet
- Amazon
- Netflix
- Goldman Sachs

You may find the documentation on how the SEC API works here and here. This logic would be the basis for a service that fetches reports and exposes this data to other teams in Quartr.

So given a list of companies you need to fetch the latest 10-K reports from each company and convert them to PDF format.

The submission **must be written in Python** and should contain the following:

- Source code with instructions on how to run the code
- The prompt log if any AI tool was used
